Eucalyptus nitens (Ribbon gum, Shinning gum) FLORIDA			Score
1.01	Is the species highly domesticated?	n	0
1.02	Has the species become naturalised where grown?		
1.03	Does the species have weedy races?		
2.01	Species suited to FL climates (USDA hardiness zones; 0-low, 1-intermediate, 2-	2	
	high)		
2.02	Quality of climate match data (0-low; 1-intermediate; 2-high)	2	
2.03	Broad climate suitability (environmental versatility)	У	1
2.04	Native or naturalized in regions with an average of 11-60 inches of annual precipitation	У	1
2.05	Does the species have a history of repeated introductions outside its natural range?	У	
3.01	Naturalized beyond native range	У	2
3.02	Garden/amenity/disturbance weed	n	0
3.03	Weed of agriculture	n	0
3.04	Environmental weed	n	0
3.05	Congeneric weed	У	2
4.01	Produces spines, thorns or burrs	n	0
4.02	Allelopathic	?	
4.03	Parasitic	n	0
4.04	Unpalatable to grazing animals	n	-1
4.05	Toxic to animals	?	
4.06	Host for recognised pests and pathogens	?	
4.07	Causes allergies or is otherwise toxic to humans	?	
4.08	Creates a fire hazard in natural ecosystems	?	
4.09	Is a shade tolerant plant at some stage of its life cycle	n	0
4.10	Grows on infertile soils (oligotrophic, limerock, or excessively draining soils). North & Central Zones: infertile soils; South Zone: shallow limerock or	n	0
	Histisols.		
4.11	Climbing or smothering growth habit	n	0
4.12	Forms dense thickets	n	0
5.01	Aquatic	n	0
5.02	Grass	n	0
5.03	Nitrogen fixing woody plant	n	0
5.04	Geophyte	n	0
6.01	Evidence of substantial reproductive failure in native habitat	n	0
6.02	Produces viable seed	У	1
6.03	Hybridizes naturally	У	1
6.04	Self-compatible or apomictic	?	
6.05	Requires specialist pollinators	n	0
6.06	Reproduction by vegetative propagation	n	-1
6.07	Minimum generative time (years)	5	-1

Completed: July 2012

	Risk Assessment Results	Ac	cept
	Implemented Pacific Second Screening	ľ	lo
	Total Score		0
8.05	Effective natural enemies present in U.S.		
8.04	Tolerates, or benefits from, mutilation or cultivation	3	
8.03	Well controlled by herbicides	?	
8.02	Evidence that a persistent propagule bank is formed (>1 yr)	n	-1
8.01	Prolific seed production	n	-1
7.08	Propagules dispersed by other animals (internally)	n	-1
7.07	Propagules dispersed by other animals (externally)	n	-1
7.06	Propagules bird dispersed	n	-1
7.05	Propagules water dispersed	3	
7.04	Propagules adapted to wind dispersal	?	
7.03	Propagules likely to disperse as a produce contaminant	n	-1
7.02	Propagules dispersed intentionally by people	У	1
	trafficked areas)		
7.01	Propagules likely to be dispersed unintentionally (plants growing in heavily

Gene flow between introduced and native <i>Eucalyptus</i> species: exitic hybrids are establishing in the wild. <i>Australian Journal of Botany</i> , 51(4): 429-439.	No computer analysis was performed. 1. New South Wales, Victoria, and Tasmania, Australia: Global plant hardiness zones 8-10; equivalent to USDA Hardiness zones 8a-10b (north, central, south zones of Florida). 2. Distributional range: native to New South Wales (east) and Victoria (east), Australia. 3. Locally abundant, in wet forest and rainforest margins on fertile soils in cool high-rainfall areas; Point Lookout and Barrington Tops districts and south from the Jingera district. NSW subdivisions: NT, ST. 4. <i>E. nitens</i> is exotic to the island (Tasmania) as it is native only to continental Australia (Pederick 1979).
2.02		No computer analysis was performed. Native range is well known; refer to 2.01 source data.

Rejmánek, eds. Encyclopedia of Biological Invasions . Berkeley: University of California Press.
- 1. It is likely that most *Eucalypts* are allelopathic-having the potential to suppress understory plants through chemical inhibitors that leach into the soil. 2. There are many reports in global literature of toxic inhibition of germination and growth of other plant species (allelopathic effects), which inhibits the growth of an understory. 3. Concerns expressed about suppression of ground vegetation due to possible allelopathic effects. Allelopathic effects are widely reported and these reports are largely based on laboratory bioassays. If not chemical inhibition then at least accumulation of dead material of the floor of eucalypt plantations hinders regeneration of native species.

- 1. It has been suggested that a toxin caused by Eucalyptus nitens leaves has been found in a Tasmanian river that is local GP, Dr. Alison Bleaney and Sydney scientist, Dr. Marcus Scammell, found that water samples from George River were toxic to water fleas, oyster larvae, and sea urchins. University of New South Wales environmental toxicologist Christian Khalil said whatever agent was in the water was 100 per cent toxic to human skin, liver and lung cells as well, although the extent of the impact on the entire body is unknown. New Zealand ecotoxicologist Chris Hickey reviewed and repeated the tests using foam from the river, including from a site near the drinking water intake for the town of St Helens. He found the foam toxic to mussel larvae. A Tasmanian government investigation came to the same conclusion but have concluded that it is not an issue since it's naturally occurring. 2. A motion for senate investigation enacted by Senator Bob Brown on the toxicity of the George River in north-east Tasmania with reference to Eucalyptus nitens plantations and its possible impacts of leacheate; impacts on the toxicity to human health and wildlife; previous investigations into the toxicity of George River; breeding and/or genetic modifications of plantation trees; current breeding programs; mitigation measures; any related topics.

Carnegie, A.J. 2007. Forest health condition in New South Wales, Australia, 1996–2005. II. Fungal damage recorded in eucalypt plantations during forest health surveys and their management. *Australasian Plant Pathology*, 36(3): 225-239.

1. The juvenile leaves are unpalatable to many pests, in some cases eve to the leaf-cutting atta ants of Brazil. The pests attack the adult leaves. 2. Insects: Coryphodema tristis (cossid moth, goat moth); Diseases: Botryosphaeria dothidea (Botryosphaeria canker). 3. Teratosphaeria nubilosa is a serious leaf disease pathogen of Eucalyptus spp., including E. nitens, in native and introduced areas. 4. Kirramyces eucalypti caused severe leaf damage in Australia (Walker et al 1992) and significant defoliation (>95% severity) of *Eucalyptus nitens* plantations over several years in Tasmania (Yuan 1999) and new Zealand (Dick 1982; Gadgil & Dick 1983; Hood et al. 2002; Hood & Alexander 2006). Caliciopsis sp. 'pleomorpha' was associated with severe cankers leading to tree mortality in E. nitens . Mycosphaerella cryptica caused significant damage to *E. nitens* . The root rot pathogens *P. cinnamomi* and Pythium sp. were associated with mortality on 12 occasions. Affected hosts included E. nitens . Significant damage (tree mortality) was associated with C. eucalypticola in E. nitens growing on low-quality sites in south-eastern NSW, in trees attacked by weevils and buprestid beetles. Similar damage to E. nitens was also observed in eastern Victoria (A. J. Carnegie, pers. obs). This appears to be the first report of this association and damage, and requires further work.

- 1. Eucalypts often are the major source of fuel for fires, but not always. 2. Leaves of eucalypts are relatively slow to breakdown and have a high volatile oil content, which contributes to the severity of fire events in their native Australia. 3. It is very sensitive to fire and is killed even by light wild fire. 4. Accumulated litter in dense stands of eucalypt stands are extremely flammable.

6.02	1. Orwa, C.A. et al. 2009. Agroforestree Database: a tree reference and selection guide version 4.0 (http://www.worldagroforestry.org/sites/treedbs/treedatabases.asp [http://www.worldagroforestry.org/af/treedb/AFTPDFS/Eucalyptus_urophylla.pdf]).	1.a. There are approximately 260,000 viable seeds/kg. 1.b. If sufficient seed is available after fire, the regeneration is prolific, and regrowth develops rapidly on the resulting ash bed.
6.03	1. Barbour, R.C. et al. 2003. Gene flow between introduced and native Eucalyptus species: exitic hybrids are establishing in the wild. Australian Journal of Botany, 51(4): 429-439.	1.a. Hybrids between plantation-grown <i>E. nitens</i> and the native species <i>E. ovata</i> were previously identified in open-pollinated seed from <i>E. ovata</i> (Barbour et al 2002); however, whether these hybrids can establish in the wild was unknown. Presented here is the first evidence that exotic F1 hybrid seedlings, arising from fertilization of native <i>E. ovata</i> by plantation-grown <i>E. nitens</i> pollen, are establishing in the wild. 1.b. Morphological and allozyme analysis has shown that F1 hybridization between plantation and native <i>Eucalyptus</i> is occurring (Barbour et al 2002; present study) and the present study shows that these hybrids are establishing in the wild.
